

Apache Kafka Quiz

30 questions. Answers revealed on the next slide.

30

Pencils ready. No peeking at the broker.

What is the basic unit of data in Kafka?

A

A row

B

A record (message/event)

C

A tuple

D

A packet of regret

What is the basic unit of data in Kafka?

A

A row

B

A record (message/event)

C

A tuple

D

A packet of regret

What is a Kafka topic?

A

A named, logical stream of records

B

A type of broker

C

A conversation starter at meetups

D

A consumer setting

What is a Kafka topic?

A

A named, logical stream of records

B

A type of broker

C

A conversation starter at meetups

D

A consumer setting

How are topics scaled across brokers?

A

Partitions

B

Replicas only

C

Schemas

D

Bigger coffee

How are topics scaled across brokers?

A

Partitions

B

Replicas only

C

Schemas

D

Bigger coffee

Where does Kafka guarantee record ordering?

A

Across the whole topic

B

Across the whole cluster

C

Within a single partition

D

Nowhere, it's chaos

Where does Kafka guarantee record ordering?

A

Across the whole topic

B

Across the whole cluster

C

Within a single partition

D

Nowhere, it's chaos

What is an offset?

A

A partition's replica count

B

A record's sequential position within a partition

C

A timezone adjustment

D

A broker's disk location

What is an offset?

A

A partition's replica count

B

A record's sequential position within a partition

C

A timezone adjustment

D

A broker's disk location

What is a broker?

A

A server that stores data and serves clients

B

A client that produces records

C

A stock trader

D

A schema validator

What is a broker?

A

A server that stores data and serves clients

B

A client that produces records

C

A stock trader

D

A schema validator

What does a producer do?

A

Reads records from topics

B

Manages cluster metadata

C

Writes records to topics

D

Produces excuses for outages

What does a producer do?

A

Reads records from topics

B

Manages cluster metadata

C

Writes records to topics

D

Produces excuses for outages

What does a consumer do?

A

Deletes old records

B

Reads records from topics

C

Elects leaders

D

Eats all your disk space

What does a consumer do?

A

Deletes old records

B

Reads records from topics

C

Elects leaders

D

Eats all your disk space

What is a consumer group?

A

A support group for stressed consumers

B

A set of brokers

C

A set of partitions

D

Consumers that share the work of reading a topic

What is a consumer group?

A

A support group for stressed consumers

B

A set of brokers

C

A set of partitions

D

Consumers that share the work of reading a topic

Question 10 of 30

In one consumer group, how many consumers can read a given partition at once?

A

Exactly one

B

As many as you like

C

Two, for redundancy

D

It depends on the moon phase

In one consumer group, how many consumers can read a given partition at once?

A

Exactly one

B

As many as you like

C

Two, for redundancy

D

It depends on the moon phase

**You have 3 partitions and 5 consumers in one group.
What happens?**

A

Kafka creates 2 more partitions

B

Two consumers sit idle

C

Records are duplicated

D

The cluster explodes

**You have 3 partitions and 5 consumers in one group.
What happens?**

A

Kafka creates 2 more partitions

B

Two consumers sit idle

C

Records are duplicated

D

The cluster explodes

Which partition setting gives fault tolerance?

A

Replication factor

B

Retention

C

Compression

D

Prayer

Which partition setting gives fault tolerance?

A

Replication factor

B

Retention

C

Compression

D

Prayer

What is the partition leader?

A

The oldest broker

B

The replica that handles reads and writes for that partition

C

The consumer with the most offsets

D

The one who schedules the meetings

What is the partition leader?

A

The oldest broker

B

The replica that handles reads and writes for that partition

C

The consumer with the most offsets

D

The one who schedules the meetings

What does ISR stand for?

A

Internal Storage Region

B

Incremental Sync Record

C

In-Sync Replicas

D

I Should Restart

What does ISR stand for?

A

Internal Storage Region

B

Incremental Sync Record

C

In-Sync Replicas

D

I Should Restart

What does KRaft replace?

A

ZooKeeper

B

Kafka Connect

C

Kafka Streams

D

The Kraken

What does KRaft replace?

A

ZooKeeper

B

Kafka Connect

C

Kafka Streams

D

The Kraken

With acks=all, when does the producer consider a write successful?

A

When it leaves the producer's buffer

B

When the leader alone writes it

C

When the consumer reads it

D

When all in-sync replicas have it

With acks=all, when does the producer consider a write successful?

A

When it leaves the producer's buffer

B

When the leader alone writes it

C

When the consumer reads it

D

When all in-sync replicas have it

How does the default partitioner route records with a key?

A

By hashing the key

B

Randomly

C

Always to partition 0

D

By key alphabetical order

How does the default partitioner route records with a key?

A

By hashing the key

B

Randomly

C

Always to partition 0

D

By key alphabetical order

What is stored in the `_consumer_offsets` topic?

A

Consumer passwords

B

Committed consumer group positions

C

Deleted records

D

Stuff Kafka is embarrassed about

What is stored in the `__consumer_offsets` topic?

A

Consumer passwords

B

Committed consumer group positions

C

Deleted records

D

Stuff Kafka is embarrassed about

What is Kafka Connect used for?

A

Connecting brokers to each other

B

Debugging network issues

C

Streaming data between Kafka and external systems

D

Making friends

What is Kafka Connect used for?

A

Connecting brokers to each other

B

Debugging network issues

C

Streaming data between Kafka
and external systems

D

Making friends

What is Kafka Streams?

A

A client library for processing data stored in Kafka

B

A video streaming service

C

A broker plugin for storage

D

A separate cluster you must deploy

What is Kafka Streams?

A

A client library for processing data stored in Kafka

B

A video streaming service

C

A broker plugin for storage

D

A separate cluster you must deploy

What does a Schema Registry provide?

A

Broker discovery

B

Topic backups

C

A list of who broke production

D

Central storage and versioning of data schemas

What does a Schema Registry provide?

A

Broker discovery

B

Topic backups

C

A list of who broke production

D

Central storage and versioning of
data schemas

By default, what happens to records after they are consumed?

A

They are deleted immediately

B

They stay until retention expires

C

They move to another topic

D

They self-destruct, Mission Impossible style

By default, what happens to records after they are consumed?

A

They are deleted immediately

B

They stay until retention expires

C

They move to another topic

D

They self-destruct, Mission Impossible style

What does log compaction keep?

A

The latest record for each key

B

Only the first record for each key

C

Only records under 1 KB

D

Whatever fits in the log's trousers

What does log compaction keep?

A

The latest record for each key

B

Only the first record for each key

C

Only records under 1 KB

D

Whatever fits in the log's trousers

What is a rebalance?

A

Moving data between disks

B

Reassigning partitions among consumers in a group

C

Adjusting broker clock skew

D

Yoga for clusters

What is a rebalance?

A

Moving data between disks

B

Reassigning partitions among consumers in a group

C

Adjusting broker clock skew

D

Yoga for clusters

Which delivery semantic does Kafka support with idempotent producers and transactions?

A

Exactly-once

B

At-most-once only

C

Best-effort vibes

D

Never-once

Which delivery semantic does Kafka support with idempotent producers and transactions?

A

Exactly-once

B

At-most-once only

C

Best-effort vibes

D

Never-once

What does `auto.offset.reset=earliest` do?

A

Deletes the earliest records

B

Makes consumers start early in the morning

C

Starts a new group at the beginning of the log when no offset exists

D

Starts a new group at the end of the log

What does `auto.offset.reset=earliest` do?

A

Deletes the earliest records

B

Makes consumers start early in the morning

C

Starts a new group at the beginning of the log when no offset exists

D

Starts a new group at the end of the log

What is consumer lag?

A

The delay between a producer's sends

B

The network latency to the broker

C

The time it takes to boot a consumer

D

The gap between the latest offset and the consumer's committed offset

What is consumer lag?

A

The delay between a producer's sends

B

The network latency to the broker

C

The time it takes to boot a consumer

D

The gap between the latest offset and the consumer's committed offset

What is the role of the controller in a Kafka cluster?

A

Managing cluster metadata and partition leader elections

B

Serving all producer writes

C

Running the TV remote

D

Compressing messages

What is the role of the controller in a Kafka cluster?

A

Managing cluster metadata and partition leader elections

B

Serving all producer writes

C

Running the TV remote

D

Compressing messages

Why is Kafka so fast at writes?

A

It stores everything in RAM only

B

It skips writing to disk

C

It uses sequential disk I/O and the page cache

D

It cheats by dropping records

Why is Kafka so fast at writes?

A

It stores everything in RAM only

B

It skips writing to disk

C

It uses sequential disk I/O and the page cache

D

It cheats by dropping records

What is a common way to increase a topic's throughput?

Add more partitions (and consumers)

Rename the topic to something faster

Lower the replication factor to 0

Shout at the broker

What is a common way to increase a topic's throughput?

A

Add more partitions (and consumers)

B

Rename the topic to something faster

C

Lower the replication factor to 0

D

Shout at the broker

That's a wrap!

Tally your scores. Highest lag buys the coffee.
